ANDERSON ALEXIS AGUILAR CACHAY

INTER 08 – WRITING 01

The process of building a water bottle will be described by me at this time. First, the mold is created by company staff. the mold is very unique because it is made of iron and metal that are the most resistant materials for molds. Then, the polyethylene terephthalate (PET) is blown into the mold. After that, the mold with the PET is dried by company staff. Next, the mold is opened by a machine and the dried PET is cleaned by a smart machine. Finally, the bottle of PET is processed by the company staff and they sell their product to water companies. This process is easier to do than the process of glass bottle. the product of plastic bottle is not essential, but it is more affordable and portable than others like glass bottle.
